                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                      vector. The vector comprises a heterologous nucleotide sequence encoding B-domain deleted factor VIII operably linked with at least one enhancer and at least one promoter. The method results in the production of high titer rAAV vector stocks carrying the B-domain deleted factor VIII transgenes and expression cassettes, which generate adequate titers of virus for in vivo administration. The recombinant vectors are useful for treating haemophilia A, where the liver expresses the encoded B-domain deleted factor VIII, which is secreted into the blood. They are also useful for the treatment of other coagulation disorders. The present sequence encodes a B-domain deleted factor VIII.

The invention relates to a method for expanding the population of CC endothelial cells (EC) obtained from peripheral blood, by culturing, CC in contact with a collagen I coated surface, buffy coat cells obtained CC from peripheral mammalian blood in the presence of a culture medium CC containing vascular endothelial growth factor (VEGF) and free of bovine brain extract. EC are useful for treating hemophilia by introducing it CC into the blood stream of a mammal, so that an effective amount of CC fractor VIII protein is secreted in the blood stream of the mammal. CC will gene into which an enhanced green fluorescent protein coding CC sequence (HSQ) has been inserted, is subcloned. Transgenic EC transduced in vitro are useful for improving prosthetic implants. EC is also useful for diagnosing clotting disorders where indication or disease is CC associated with a reduction in the activity of an enzyme. EC is also useful in gene therapy for treating the variety of diseases including adenosine deamninase deficiency, sixkle cell anemia, thalassemia, then activity of an enzyme activity of such as Alzheimer's disease, heart diseases, defects in immune system, for reactive benefit and transfers.

It was obtd. by PCR amplification (see also AAT69812-13) of the HCII acidic region from total liver cDNA, fusion to sequences encoding Factor VIII total liver cDNA, fusion to sequences encoding Factor VIII aa706-711 and aa737-743, and incorporation of the construct into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plasmid pCLB-dB695. The hybrid protein, which can be expressed using gene therapy techniques, has increased procoagulant activity owing to the HCII acidic region, and can be used to treat blood coagulation disorders such as haemophilia A.

intravenously to a human. The long term systemic expression results in a comeasurable level of the therapeutic protein being produced in the blood cof the human for a period of at least 30 days after the administration of the RRV vector preparation. RRV's can be used for in vivo delivery of therapeutic protein to treat, e.g. haemophilia A, haemophilia B, cycler such as thalassemia, phenylketonuria, Lesch-Nyhan syndrome, combined immunodeficiency (SCID), cystic fibrosis, Duchenne's evere combined immunodeficiency (SCID), cystic fibrosis, Duchenne's constitutypsin deficiency, adenine deaminase deficiency, alpha1-contitutypsin deficiency, Guacher's syndrome, anaemia, infections such as contitutypsin deficiency, Guacher's syndrome, anaemia, infections such as contituty disease or graft versus host disease, RRV's are capable of curviving inactivation in human serum thereby allowing efficient gene considered periods of time.
                                                                  Matches
                                                                                                                                                      Sequence 4832 BP; 1381 A; 1089 C; 1055 G; 1307 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          expressing a therapeutic protein. The RRV preparation is resistant to degradation by human complement and is capable of inducing long term systemic expression of the therapeutic protein when administered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This cDNA encodes the beta-domain deleted SQN deletion protein of human factor VIII. This is used in the construction of recombinant retroviral vectors expressing human factor VIII. The invention provides the preparation of replication defective recombinant retrovirus (RRV)

The invention relates to preparations of replication defective recombinant retrovirus (RV) expressing a B domain deleted human Factor VIII protein, where the recombinant RV is capable of infecting human cells, is resistant to degradation by human complement and is capable of inducing long-term (at least 30 days and up to 6 months or longer post-injection) systemic expression of Factor VIII when administered to a haemoghilla A patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This DNA sequence includes a coding region for the B domain deletion mutant SQN (see AAW44372) of human Factor VIII. The SQN mutant is created by fusing Ser-743 to Gln-1638 of native Factor VIII (see AAW44373) to form a Ser-Gln-Asn (SQN) link between the A2 and A3 Factor VIII domains. When compared to plasmid-derived and A3 Factor VIII domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 6; Page 174-175; 236pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19-SEP-1996
                                                                                                                                                                                                                                                                                                                                                                                           11-JUL-1996
                                                                                                                                                                                                                                                                                                                                                                                                                      W09621035-A2
                        transduce cells either in vivo or ex vivo. Factor-VIII expressed from such transduced cells will be processed and transported in a fashion analagous to the expression product of a normal Factor-VIII gene. Retroviral particles harbouring such vectors will be useful in the gene therapy of haemophilia A.
                                                                                                                                                                                                                                                                                                                                       30-DEC-1994;

in the bloodstream. The A2 domain mutants exhibit reduced LRP-dependent (receptor-dependent) clearance of factor VIII, while C2 domain mutants have reduced LRP-dependent clearance. The invention also relates to a method of using RAP (receptor associated protein), a protein which inhibits LRP (low density lipoprotein related protein)-mediated ligand internalisation, to increase the half-life of factor VIII. The mutant factor VIII proteins, and nucleotides encoding them, are useful for treating haemophilia. RAP, LRP-binding RAP mutants or fragments, and nucleic acids encoding them may also be used in the treatment of haemophilia, in combination with a mutant factor VIII protein or DNA of the invention. The invention provides means of increasing the half-life of factor VIII by reducing its clearance from plasma. The present sequence represents cDNA encoding human factor VIII.
                                                                                                                                                                                                                                                                                                                                                                                                                              amino acid substitution at one or more positions in the C2 domain. The invention also encompasses a factor VIII mutant which lacks a B domain (AAB48842). The factor VIII mutants have an increased half-life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human factor VIII mutants comprising an amin acid substitution at one or more positions in the A2 domain and/or an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 41; Page 86-101; 121pp; English.

                                                                                                                                                                                                                                                                      The gene encodes human factor VIII. The factor VII is produced in pure form and in useful amts. using recombinant DNA technology. Factor VIII can be used to correct factor VIII deficient plasma, and activates factor xt oxa in the presence of factor IXa, Ca and phospholipid. These to activities are inactivated by antibodies specific for factor VIII. The activity of the prod. is bound to an specific monoclonal antibody specific for factor VIII. Factor VIII activity is activated by thrombin. The activity is bound to, and can be eluted from, immobilised von Willebrand factor. Dose of factor VIII is 20-40 units/kg over 8 hours i.v. for maintenance therapy for haemophilia, 40 units/kg for preoperative conditions, or 15-20 units/kg for minor haemorrhaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human factor VIII gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC known binding sites at the N-terminus and within the C2 domain.

CC Haemophilia A is frequently caused by an intron 22 inversion in the C2 decoming inverted and localised telomeric to two sections, exons 1-22 becoming inverted and localised telomeric to the original site, while C2 exons 23-26 remain isolated at the original site. Exons 23-26 a portion on functional. The factor VIII gene product of individuals with this C2 mutation thus comprises domains, without which factor VIII is comproteolysis is non-functional, resulting in a bleeding disorder. The C3 invention relates to a novel method for for treating haemophilia A in a cadministering to the mammal either an effective amount of factor VIII gene encoding it, and may be useful for treating patients such as those whose haemophilia A is caused by intron 22 cinversion. The recombinant factor VIII products of this invention are creduces the risk of pathogenic infection which was previously a problem can using domated plasma. Furthermore, the invention provides a more can seed of providing factor VIII activity to patients who can are at risk of producing antibodies against full-length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents cDNA encoding the full-length human factor VIII. In this form, the protein is 300 kD in size with the domain structure Al-A2-B-A3-C1-C2. However, prior to secretion, this 300 kD protein is proteolysed into a heavy chain (Al-A2-B, with continued proteolysis within the B domain resulting in molecules of varying length) and a light chain (A3-C1-C2) that remains non-covalently attached to the heavy chain. Upon secretion, factor VIII is rapidly cleared from the circulation unless it is bound by the plasma protein von Willebrand Factor (VWF). Factor VIII binds to VWF through the light chain, with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DЪ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ωy
                                                       The present sequence was used in an example illustrating an invention relating to a crystal of protein-ligand complex, which comprises an N-terminal truncated factor VIII and a ligand. The crystal diffracts x-rays to determine the atomic coordinates of the protein-ligand complex to a resolution of more than 5.0 Angstrom. The N-terminal truncated factor VIII retains the C2 domain of, and lacks at least 2000 amino acids from the flexible N-terminus of, the full-length factor VIII. The crystal is useful in drug screening assays. The method comprises selecting a potential ligand by performing structure-based drug design with a three-dimensional structure determined for the crystal preferably in conjunction with computer modelling. The potential ligand is contacted with the ligand binding domain of factor VIII and the
     binding is detected. A potential ligand is selected as a potential drug on the basis of its binding to the ligand binding domain of factor VIII with a similar affinity to a standard ligand, such as
                                                                                                                                                                                                                                                                                                                                                   Crystals of protein-ligand complex useful for developing new therapeutic drug agents, comprises carboxy terminal C2 domain of human blood coagulation factor VIII and a ligand -

The N-terminal truncated factor VIII is also useful for identifying and analysing mutant variants of the C2 domain of factor VIII that can be incorporated into full-length factor VIII. The variants are useful for treating haemophiliac patients to display reduced or altered immune responses to treatments with factor VIII.
